

CSE-4301  
Object Oriented Programming  
2022-2023

**Week-7**

# Pointers and Reference

-Faisal Hussain  
Assistant Professor, Department Of Computer Science And Engineering, IUT

# Contents

---

- ▶ **Addresses and Pointers**
- ▶ **The Address-of Operator &**
- ▶ **Pointers and Arrays**
- ▶ **Pointers and Functions**
- ▶ **Pointers and C-Type Strings**
- ▶ **Memory Management:** new **and** delete
- ▶ **Pointers to Objects**
- ▶ **A Linked List Example**
- ▶ **Pointers to Pointers**

# Addresses and Pointers

# The Address-of Operator &

```
int var1;  
cout<<&var1;  
/* &var1 indicates the  
address of var1*/
```

# Pointers

---

- ▶ A variable that holds an address value is called a *pointer variable*, or simply a *pointer*
- ▶ `char* ptr1, * ptr2, * ptr3; // three variables of type char`  
`char *ptr1, *ptr2, *ptr3; // three variables of type char`
- ▶ When an asterisk is used in front of a variable name, as it is in the `*ptr` expression, it is called the **dereference operator** (or sometimes the **indirection operator**). It means *the value of the variable pointed to by*.

# Pointers

```
float flovar = 98.6;  
int* ptrint = &flovar;  
//ERROR: can't assign float* to int*
```

## ► **Pointer to void**

```
void* ptr;  
//ptr can point to any data type
```

## ► **The const Modifier and Pointers**

```
const int* cptrInt;  
//cptrInt is a pointer to constant int  
//using cptrInt you cannot assign any value.  
//*cptrInt = 10;
```

```
int* const ptrcInt;  
//ptrcInt is a constant pointer to int  
//Once you initialize ptrcInt you cannot change
```

# A Linked List Example

---

## ► Chain of pointer

```
Struct link{  
    int data;  
    link * next;  
}
```

```
Class linklist{  
    private: link* first;  
    ....  
};
```

# Self-Containing Classes

---

```
class sampleClass
{
    sampleClass* ptr;
};
```

```
class sampleClass
{
    sampleClass obj; /// Error
}
```

# Memory Management: new and delete

`char* ptr;`  
Data types must agree

`ptr = new char[len];`  
Pointer   Keyword   Brackets   Number of type `char` variables  
Data type of variables

# The delete Operator

---

- ▶ Deleting the memory doesn't delete the pointer that points to it (str in NEWINTRO), and doesn't change the address value in the pointer.
- ▶ However, this address is no longer valid; the memory it points to may be changed to something entirely different. Be careful that you don't use pointers to memory that has been deleted. .
- ▶ **Don't forget the brackets when deleting arrays of objects.** Using them ensures that all the members of the array are deleted, and that the destructor is called for each one.

# Pointers to Object/s

---

**\*\*use the distance class code to understand\*\***

```
distptr.getdist(); // won't work; distptr is not a variable  
(*distptr).getdist(); // ok but inelegant
```

```
distptr->getdist(); // better approach
```

Creating a pointers do not trigger constructor.

**\*\*use the pointer to objects code to understand\*\***

# Pointers to Pointers

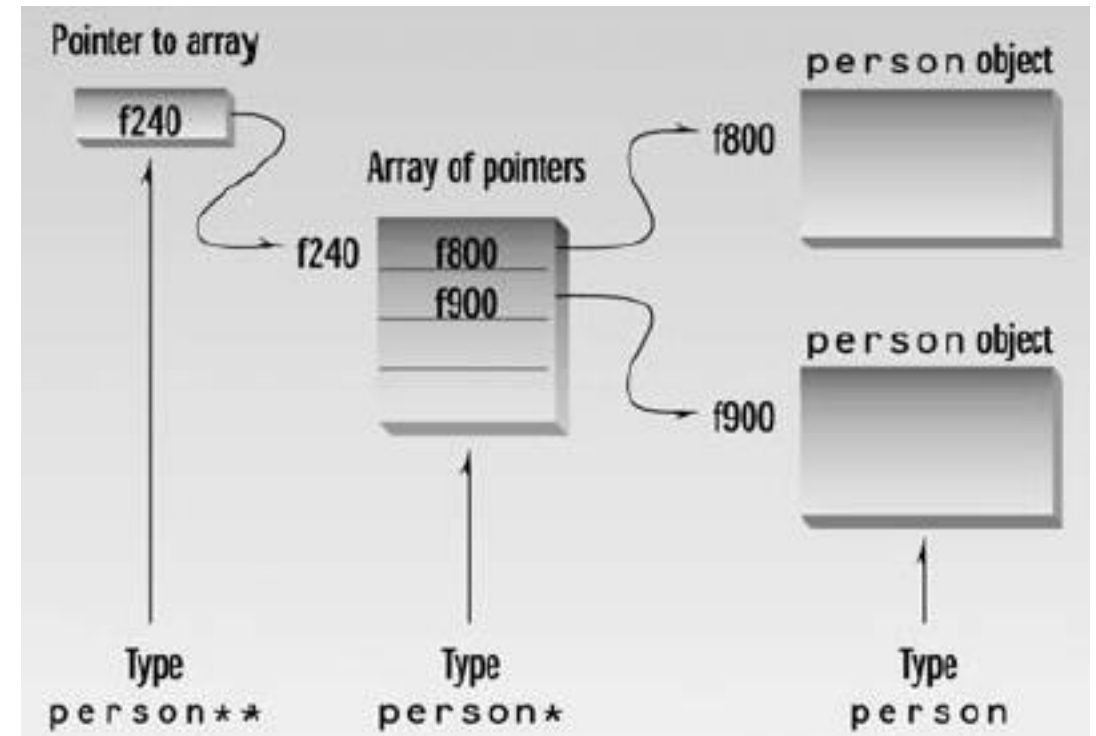

- ▶ \*\* use code to understand the use of Pointers to Pointers”

```
Person *p[10];
```

*// An array of 10 pointers of Person class*

```
Person **p2p = p;
```

*// p2p pointer to pointer points to array of pointer*

# Reading Assignment

---

- ▶ A parsing Example
- ▶ Designing Horse Race
